

One Lesson. Every Student.

Differentiate your teaching in minutes, not hours.

"Use Claude to teach the same thing differently to every learner in the room."

THE PROBLEM

You plan one lesson. You walk into a room of 30 students who are each somewhere completely different — one is still confused about last week, another already knows the basics and is bored before you start, and everyone else is scattered in between. One explanation cannot reach all of them. You know this. The challenge is that writing three versions of every lesson takes hours you don't have.

Differentiated instruction is one of the most researched strategies in education. It works. But it's been treated as a luxury — something only teachers with unlimited prep time can actually do. Every teacher knows the theory. Almost none have time to practice it consistently across every subject, every unit, every week.

Claude changes that math. Give it your topic, your grade level, and three minutes. It will hand you three distinct explanations — one scaffolded for students who are struggling, one for students at grade level, and one for students who are ready to go deeper. Plus a single discussion question that can pull all three groups into the same conversation. This kit gives you the exact prompt.

Copy this prompt before your next lesson. Fill in the two brackets. Run it at claude.ai — free, no account required.

```
I'm teaching [topic] to [grade level or age group].
```

```
Please give me three versions of an explanation for this lesson:
```

- ```
1. For a student who is struggling and needs it broken
 into smaller steps
```
- ```
2. For a student who is at grade level
```
- ```
3. For a student who already gets the basics and needs
 to go deeper
```

```
Then give me one discussion question that works for all
three groups at the same time.
```

### HOW TO FILL IT IN

→ **[topic]** — be as specific as possible. "Fractions with unlike denominators" works better than "math."

→ **[grade level or age group]** — "4th grade," "high school freshmen," "adult learners" all work.

→ You can add context: "Many of my students are English language learners" or "this is a mixed-ability class."

→ Claude will adapt tone, vocabulary, and examples for each level automatically.

**The situation:** You're teaching fractions to a 4th-grade class. You fill in: *"I'm teaching fractions to a 4th-grade class."* Here's what Claude gives back.

**For a struggling student:** A fraction is a way to show part of something. Think of a pizza cut into 4 equal slices. If you eat 1 slice, you ate 1 out of 4 pieces — we write that as  $\frac{1}{4}$ . The bottom number tells you how many total pieces. The top number tells you how many you have.

**For a grade-level student:** A fraction represents part of a whole. The denominator (bottom) tells you how many equal parts the whole is divided into. The numerator (top) tells you how many of those parts you're talking about.  $\frac{3}{4}$  means 3 out of 4 equal parts.

**For an advanced student:** A fraction is one way to represent a rational number — any number that can be expressed as a ratio of two integers. When you add fractions with unlike denominators, you're finding a common unit to measure both parts. That's why you need a common denominator — it's about making the units match.

**Universal discussion question:** *"If you had  $\frac{3}{4}$  of a pizza and your friend had  $\frac{2}{4}$  of a pizza, who has more — and how do you know?"*

## YOUR TURN

---

Take one lesson you're planning this week — any subject, any grade. Paste the prompt into Claude, fill in your topic and grade level, and run it. You'll have three differentiated explanations and a discussion question before your coffee gets cold.

*You can run this for each unit across your whole curriculum. Save Claude's output in a doc alongside your lesson plan — you'll have a differentiation bank built up within a few weeks.*
