

Study Anything with Claude

Have a real conversation. Actually learn.

Don't ask Claude for the answer. Ask it to teach you.

FOR: YOUNG LEARNERS · STUDENTS · ANYONE IN SCHOOL

Ejoshi

You're Using Claude Wrong. Here's the Fix.

When students discover AI, the first move is always the same: type the question, copy the answer, move on. It feels like a cheat code. It kind of is — except you don't actually learn anything.

Think about what happens a week later. You've submitted the homework, maybe even got a good grade. But if someone asks you to explain the topic in your own words, you're stuck. The AI answered. You didn't.

Here's the thing: Claude isn't just a better search engine. It's a thinking partner. And if you know how to talk to it right, it can teach you anything — the same way a great tutor would. It'll ask what you already know. It'll build on that. It'll correct you when you're wrong and explain why. That's how real learning works.

This kit gives you a single prompt that turns Claude into your personal tutor. One topic. One conversation. Actual understanding.

The Study Conversation Starter

Copy this prompt and paste it into Claude. Replace the bracket with your topic.

I'm trying to understand [topic]. I don't need you to give me the answer — I want to actually learn it.

Start by asking me what I already know about it. Then teach me the parts I'm missing, one concept at a time. Check in with me as you go. If I say something wrong, correct me gently and explain why.

HOW TO FILL IT IN

- > **Replace [topic]** with what you're studying — a history event, a math concept, a science unit, a vocab word.
- > **Be honest:** when Claude asks what you know. Say exactly what you understand and what's still confusing.
- > **Stay in the conversation:** don't read the explanation and close the tab. Answer back. Ask your own questions.

Topic: The Water Cycle

A student is studying for a science test. They fill in [topic] with "the water cycle" and send the prompt to Claude.

CLAUDE ASKS:

"Before we dive in — what do you already know about the water cycle? Even if it's just one or two things, tell me what comes to mind."

THE STUDENT SAYS:

"I know water evaporates from the ocean and then it rains. That's pretty much it."

CLAUDE BUILDS ON THAT:

"That's a solid start — you've got evaporation right. Now let's fill in the middle. After water vapor rises into the air, it cools down and turns back into tiny water droplets — that's called condensation. Those droplets form clouds. When enough droplets collect, they fall as precipitation — rain, snow, sleet. After that, where do you think the water goes?"

The student stays in the conversation. Claude keeps asking. By the end, they understand — not just the words, but how it actually works.

Try It This Week

1. Pick one topic you're studying right now — anything at all.
2. Open Claude at claude.ai. It's free. No account needed.
3. Paste the prompt from page 3. Replace [topic] with your subject.
4. Stay in the conversation. Answer Claude's questions. Ask your own. You'll know more by the end than when you started.
